Amendments to the Claims: This listing of claims will replace all prior versions, and listings, of claims in the application

Listing of Claims:

1. (Currently Amended) A receiver for a firearm, said receiver comprising:
a front, at least two sides, and a bottom;
a front recess to receive a barrel or barrel extension, said front recess defined by a channel in said receiver which is open longitudinally along a longitudinal slit in said receiver;
a load/eject recess open to said front recess and to at least one side or said bottom of said receiver, said load/eject recess sized to allow the insertion and removal of a cartridge from said receiver;
said slit and said load/eject recess together forming a single opening to said receiver whereby said receiver has a radially inward bias expandable against the radially inward bias to allow the insertion of a barrel or barrel extension into said front recess, said front recess having an at-rest position smaller than the outer diameter dimension of the barrel or barrel extension which it is sized to receive to thereby anchor a barrel or barrel extension in place with respect to the receiver without additional compression means.
2. (Previously Presented) The receiver of claim 1 wherein said slit and said load/eject recess are open to said bottom of said receiver.
3. (Withdrawn) The receiver of claim 1 further comprising a clamping hole in said receiver disposed through said longitudinal slit, said clamping hole sized to receive clamping means whereby said slit is compressible by said clamping means to apply a compressive force on a barrel or barrel extension inserted into said front recess.
4. (Withdrawn) The receiver of claim 2 wherein said clamping means is a bolt.
5. (Previously Presented) The receiver of claim 1 wherein said front recess is sized to receive a barrel extension after said receiver is expanded from its at-rest position.
6. (Withdrawn) The receiver of claim 2 wherein said receiver has a plurality of clamping holes.

7. (Withdrawn) The receiver of claim 1 wherein said receiver is comprised of a material selected from the group consisting of aluminum, magnesium, or alloys comprised of aluminum or magnesium.
8. (Withdrawn) The receiver of claim 1 wherein said receiver is comprised of a polymeric material.
9. (Withdrawn) A receiver for a firearm, said receiver comprising: a front and a bottom; a front recess to receive a barrel extension, said front recess defined by a channel open longitudinally at its bottom along a longitudinal slit; a load/eject recess open to said front recess and to said bottom of said receiver to allow the insertion and removal of a cartridge from said bottom of said receiver; and at least one clamping hole in said receiver, said clamping hole disposed through said longitudinal slit, said clamping hole sized to receive clamping means; said slit and said load/eject recess together forming a single opening along said bottom of said receiver, and said front recess is expandable and contractible along said slit whereby said slit is compressible by said clamping means to apply a compressive force on a barrel extension inserted into said front recess.
10. (Withdrawn) The receiver of claim 9 further comprising clamping means.
11. (Withdrawn) The receiver of claim 9 wherein said receiver has a plurality of clamping holes.
12. (Withdrawn) The receiver of claim 9 wherein said receiver is comprised of a material selected from the group consisting of aluminum, magnesium, or alloys comprised of aluminum or magnesium.
13. (Withdrawn) The receiver of claim 9 wherein said receiver is comprised of a polymeric material.

14. (Withdrawn) A barrel extension for a firearm barrel, said barrel extension comprising:
a metallic tube having an outer surface;
and a protrusion extending radially outward from said outer surface of said metallic tube.
15. (Withdrawn) The barrel extension of claim 14 wherein said protrusion is a pin.
16. (Withdrawn) A safety mechanism for a firearm to prevent unintentional firing of the firearm, the safety mechanism comprising:
a bolt having:
a bolt head disposed at a distal end,
a proximal end, and
a longitudinal channel disposed in said bolt to house a firing pin;
a firing pin disposed in said longitudinal channel of said bolt, said firing pin having a distal end at said bolt head and a proximal end extending out of said longitudinal channel to allow activation of said firing pin by a hammer;
a safety bar disposed at said proximal end of said firing pin wherein rotation of said bolt into a firing position rotates said safety bar into an activation position whereby said firing pin can be activated by a hammer striking said safety bar, and rotation of said bolt into a non-firing position rotates said safety bar out of said activation position whereby a falling hammer cannot strike said safety bar or firing pin.
17. (Withdrawn) The safety mechanism of claim 16 wherein said safety bar is rectangular.
18. (Withdrawn) The safety mechanism of claim 16 wherein said safety bar has at least one curved edge.
19. (Withdrawn) The safety mechanism of claim 16 wherein the bolt rotation between said activation position and said non-firing position is an angle between 20° and 50° from the bolt's fully closed position.

20. (Withdrawn) The safety mechanism of claim 18 wherein the bolt rotation between said activation position and said non-firing position is an angle between 10° and 20° from the bolt's fully closed position.

21. (Withdrawn) A firearm comprising;
a barrel;
a barrel extension attached to said barrel, said barrel extension having a protrusion extending radially therefrom; and
a receiver, said receiver comprising:
a front, at least two sides, and a bottom;
a front recess to receive a barrel or barrel extension, said front recess defined by a channel in said receiver which is open longitudinally along a longitudinal slit in said receiver; and
a load/eject recess open to said front recess and to at least one side or said bottom of said receiver, said load/eject recess sized to allow the insertion and removal of a cartridge from said receiver;
said slit and said load/eject recess together forming a single opening to said receiver whereby said receiver can expand to allow the insertion of a barrel or barrel extension into said front recess;
whereby said slit accepts said protrusion to guide said barrel extension into said receiver.

22. (Withdrawn) The firearm of claim 21 further comprising a clamping hole in said receiver disposed through said longitudinal slit, said clamping hole sized to receive clamping means whereby said slit is compressible by said clamping means to apply a compressive force on said barrel extension.

23. (Withdrawn) The firearm of claim 22 wherein said clamping means is a bolt.

24. (Withdrawn) The firearm of claim 21 further comprising a safety mechanism, said safety mechanism comprising:

a bolt having:
a bolt head disposed at a distal end, a proximal end, and

a longitudinal channel disposed in said bolt to house a firing pin;
a firing pin disposed in said longitudinal channel of said bolt, said firing pin having a distal end at said bolt head and a proximal end extending out of said longitudinal channel to allow activation of said firing pin by a hammer; and
a safety bar disposed at said proximal end of said firing pin wherein rotation of said bolt into a firing position rotates said safety bar into an activation position whereby said firing pin can be activated by a hammer striking said safety bar, and rotation of said bolt into a non-firing position rotates said safety bar out of said activation position whereby a falling hammer cannot strike said safety bar or firing pin.

25. (New) The receiver of claim 1 wherein said receiver is comprised of a material selected from the group consisting of aluminum, magnesium, or alloys comprised of aluminum or magnesium.

26. (New) The receiver of claim 1 wherein said receiver is comprised of a polymeric material.
